```

```
            A[i] = cpx(round(A[i].real()), round(A[i].imag()));
        }
    }
} // referenced from https://blog.myungwoo.kr/54
*/ //faster version of FFT
```

2 Geometry
2.1 Convex Hull
```cpp
//have to include this header
#include <vector>
#include <algorithm>

using namespace std;
typedef long long ll;

typedef struct _Point {
    int x;
    int y;
} Point;

//Standard Point to Sort
Point S;

Point getVector(const Point& A, const Point& B) {
    Point v = {B.x - A.x, B.y - A.y};
    return v;
}

//ccw test
int ccw(const Point& v, const Point& u) {
    ll val = (ll)v.x * u.y - (ll)v.y * u.x;
    if(val > 0) return 1;
    else if(val < 0) return -1;
    else return 0;
}

int ccw(const Point& A, const Point& B, const Point& C) {
    Point v = getVector(A, B);
    Point u = getVector(B, C);
    return ccw(v, u);
}

//to sort by ccw
bool comp(const Point& A, const Point& B) {
    Point v = getVector(S, A);
    Point u = getVector(S, B);

    if(ccw(v, u) > 0) return true;
    else if(ccw(v, u) < 0) return false;

    return (v.x == u.x) ? (v.y < u.y) : (v.x < u.x);
}

bool operator<(const Point& A, const Point& B) {
    return (A.x == B.x) ? (A.y < B.y) : (A.x < B.x);
}

//Graham's Scan Method
vector<Point> getConvexHull(vector<Point>& A) {
    S = *min_element(A.begin(), A.end());
```

```cpp
    sort(A.begin(), A.end(), comp);
    int n = (int)A.size();

    vector<Point> convexHull;

    //get Convex Hull
    for(int i = 0; i < n; ++i) {
        while((int)convexHull.size() > 1
        && ccw(convexHull[(int)convexHull.size() - 2], convexHull.back(), A[i]) <= 0) {
            convexHull.pop_back();
        }
        convexHull.push_back(A[i]);
    }

    return convexHull;
}
```

2.2 Line Cross Test
```cpp
//have to include this header
#include <vector>

using namespace std;
typedef long long ll;

typedef struct _Point {
    int x;
    int y;
} Point;

//should define these functions(implemented in convex hull source code)
Point getVector(const Point& A, const Point& B);
int ccw(const Point& v, const Point& u);
int ccw(const Point& A, const Point& B, const Point& C);

bool operator<=(const Point A, const Point B) {
    if(A.x < B.x) return true;
    else if(A.x == B.x && A.y <= B.y) return true;
    else return false;
}

//cross test
bool isCross(const Point& A, const Point& B, const Point& C, const Point& D) {
    if(ccw(A, B, C) * ccw(A, B, D) == 0 && ccw(C, D, A) * ccw(C, D, B) == 0) {
        Point _A(A), _B(B), _C(C), _D(D);
        if(_B <= _A) swap(_A, _B);
        if(_D <= _C) swap(_C, _D);

        if(_A <= _D && _C <= _B) return true;
        else return false;
    }
    else if(ccw(A, B, C) * ccw(A, B, D) <= 0 && ccw(C, D, A) * ccw(C, D, B) <= 0) return true;
    else return false;
}
```

2.3 Point in Convex Hull Test
```cpp
//have to include this header
#include <vector>

using namespace std;
```

```cpp
typedef struct _Point {
    int x;
    int y;
} Point;

Point getVector(const Point& A, const Point& B);
int ccw(const Point& v, const Point& u);
int ccw(const Point& A, const Point& B, const Point& C);

//convexHull size >= 3
bool isInside(vector<Point>& convexHull, Point& A) {
    int O = 0;
    int L = 1, R = (int)convexHull.size() - 1;
    int M = (L + R) / 2;

    Point vecOL = getVector(convexHull[O], convexHull[L]);
    Point vecOA = getVector(convexHull[O], A);
    Point vecOR = getVector(convexHull[O], convexHull[R]);
    Point vecOM = getVector(convexHull[O], convexHull[M]);

    if(ccw(vecOL, vecOA) < 0) return false;
    if(ccw(vecOR, vecOA) > 0) return false;

    while(L + 1 != R) {
        M = (L + R) / 2;
        vecOM = getVector(convexHull[O], convexHull[M]);

        if(ccw(vecOM, vecOA) > 0) L = M;
        else R = M;
    }

    if(ccw(convexHull[L], A, convexHull[R]) <= 0) return true;
    else return false;
}
```

2.4   Rotating Calipers
```cpp
#include <vector>

using namespace std;
typedef long long ll;

typedef struct _Point {
    int x;
    int y;
} Point;

using namespace std;

//should be defined
int ccw(const Point& v, const Point& u);

double rotCalipers(vector<Point>& convexHull);
    double ret = 987654321.0;
    int b = 1, f = 0;
    int s = (int)convexHull.size();
    bool flag = false;
    while(true) {
        Point frontVector = getVector(convexHull[f], convexHull[(f + 1) % s]);
        Point backVector = getVector(convexHull[b], convexHull[(b + 1) % s]);
```

```cpp
        ret = max(ret, getDist(convexHull[f], convexHull[b]));

        if(ccw(frontVecTor, backVector) > 0) b = (b + 1) % s;
        else {
            f = (f + 1) % s;
            flag = true;
        }

        if(f == 0 && flag) break;
    }
}
```

3   Graph Thory
3.1   Bellman-Ford
```cpp
//have to include these headers
#include <vector>
#include <utility>
#define INF 987654321

using namespace std;

int N;
vector<int> dist(N, INF);

//O(VE) bellman ford algorithm
void bellman_ford(vector<vector<pair<int, int>>> adj, int start) {
    dist[start] = 0;

    //update dist
    for(int i = 1; i <= (N - 1); ++i) { //after repeat N - 1 times, it completes.
        for(int j = 1; j <= N; ++j) {
            for(auto& edge : adj[j]) { //edge.first = destination, edge.second = distance
                dist[edge.first] = min(dist[j] + edge.second, dist[edge.first]);
            }
        }
    }

    //check negative cycle
    for(int i = 1; i <= N; ++i) {
        for(auto edge : adj[i]) {
            if(dist[edge.first] > dist[i] + edge.second) {
                //if dist changes, it means that it has negative cycle
                    //cout << "YES\n";
                    return;
            }
        }
    }

    //cout << "NO\n";
}
```

3.2   Edmonds-Karp
```cpp
//time complex of this algorithm: min(O(Ef), O(VE^2))

//have to include these headers
#include <vector>
#include <queue>

using namespace std;
```

```cpp
#define V_MAX 1000
#define MAX 987654321

//adj matrix
int capacity[V_MAX][V_MAX] = { 0,};
int flow[V_MAX][V_MAX] = { 0,};

//edmonds-karp
int edmonds_karp (int source, int sink, int numOfVertex) {
    int result = 0;

    //each case of finding a path
    while (true) {
        vector<int> parent(V_MAX, -1);
        queue<int> q;
        q.push(source);
        parent[source] = source;

        //find a path(bfs)
        while (!q.empty() && parent[sink] == -1) {
            int cur = q.front();
            q.pop();
            for (int to = 0; to < numOfVertex; to++) {
                if (capacity[cur][to] - flow[cur][to] > 0 && parent[to] == -1) {
                    q.push(to);
                    parent[to] = cur;
                }
            }
        }

        //if there's no more path
        if (parent[sink] == -1) break;

        //if there's a path
        int amount = MAX;

        //find minimum residual capacity
        int now;
        for (now = sink; now != source; now = parent[now]) {
            amount = min(capacity[parent[now]][now] - flow[parent[now]][now], amount);
        }

        //edit flow
        for (int now = sink; now != source; now = parent[now]) {
            flow[parent[now]][now] += amount;
            flow[now][parent[now]] -= amount;
        }

        result += amount;
    }

    return result;
}
```

4   Linear Algebra
4.1   Gauss-Jordan
```cpp
//have to include this header
#include <vector>

using namespace std;
```

```cpp
typedef struct _Matrix{
    int N;
    vector<vector<double>> matrix;

    _Matrix(int X) {
        N = X;
        matrix.resize(N, vector<double>(N + 1));
    } // N by N + 1 matrix
} Matrix;

void rowSwap(Matrix& A, int i) {
    vector<double> temp = A.matrix[i];
    A.matrix.erase(A.matrix.begin() + i);
    A.matrix.push_back(temp);
}

//Gauss-Jordan Elmination
void gaussJordan(Matrix& A) {
    for(int i = 0; i < A.N; ++i) {
        while(A.matrix[i][i] == 0) rowSwap(A, i);
        //check diagonal components are non-zero, when if, rotate row(swap)

        for(int j = 0; j < A.N; ++j) { //make RREF
            if(i != j) {
                double ratio = A.matrix[j][i] / A.matrix[i][i];
                for(int k = 0; k <= A.N; ++k) {
                    A.matrix[j][k] = A.matrix[j][k] - ratio * A.matrix[i][k];
                }
            }
        }
    }
}
```

5   Number Theory
5.1   Euler Phi Function
Euler Phi, 오일러 피 함수 : a이하의 수 중 a와 서로소가 되는 수들의 개수

$$\phi(a)$$

$$\phi(a) = a - 1$$

(a가 소수일 경우)

$$\phi(ab) = (ab - 1) - (a - 1) - (b - 1) = \phi(a)\phi(b)$$

(a, b가 서로 서로소인 관계)

$$\phi(a^m) = a^m - a^{m-1} = a^m(1 - \frac{1}{a})$$

(a가 소수일 경우)

$$\phi(x) = x(1 - \frac{1}{p_1})(1 - \frac{1}{p_2})(1 - \frac{1}{p_3})...$$

(

$$x = p_1^k p_2^{k'}...$$

, 즉 일반적인 경우)

6 SCC

```cpp
#include <iostream>
#include <vector>
#include <stack>
#include <algorithm>

using namespace std;

vector<int> ID; int id;
vector<bool> isSCC;
vector<vector<int>> SCC;
stack<int> stackSCC;

int DFS(vector<vector<int>>& adj, int node) {
    ID[node] = ++id;
    stackSCC.push(node);

    int parent = ID[node];

    for(auto& element : adj[node]) {
        int nextNode = element;
        if(ID[nextNode] == 0) parent = min(parent, DFS(adj, nextNode));
        else if(!isSCC[nextNode]) parent = min(parent, ID[nextNode]);
    }

    if(parent == ID[node]) {
        vector<int> elementSCC;
        while(true) {
            int topNode = stackSCC.top();
            stackSCC.pop();

            elementSCC.push_back(topNode);
            isSCC[topNode] = true;

            if(topNode == node) break;
        }
        SCC.push_back(elementSCC);
    }

    return parent;
}

void solve(vector<vector<int>>& adj, int& V) {
    for(int i = 1; i <= V; ++i) {
        if(ID[i] == 0) DFS(adj, i);
    }

    cout << SCC.size() << '\n';

    for(auto& element : SCC) sort(element.begin(), element.end());
    sort(SCC.begin(), SCC.end());

    for(auto& element : SCC) {
        for(auto& x : element) cout << x << " ";
        cout << "-1\n";
    }
}

int main() {
    ios_base::sync_with_stdio(false);
    cin.tie(nullptr);
    cout.tie(nullptr);

    int V, E; cin >> V >> E;

    isSCC.resize(V + 1, false);
    ID.resize(V + 1, 0);
    vector<vector<int>> adj(V + 1);
    for(int i = 0; i < E; ++i) {
        int a, b; cin >> a >> b;
        adj[a].push_back(b);
    }

    solve(adj, V);

    return 0;
}
```

7 Plane-Sweeping

```cpp
#include <iostream>
#include <vector>
#include <algorithm>
#include <tuple>

using namespace std;

class segTree {
